

What the app uses it for	Endpoint called	Where in code
Full NAV price history + fund details for every scheme	api.mfapi.in/mf/{scheme_code}	services/amfi.py (all NAV lookups flow through here)
Fund search (user typing in search box)	api.mfapi.in/mf/search?q=...	routes/funds.py
Matching CAS statement names to fund codes	api.mfapi.in/mf/search?q=...	routes/cas.py (3 call sites)
Resolving IDCW → Growth sibling plans	api.mfapi.in/mf/search?q=...	services/idcw_resolver.py
Benchmark indices (Nifty 50 / Midcap 150 / Smallcap 250 / Nifty 500 proxies)	same /mf/{code} endpoint using index-fund scheme codes	services/analytics.py

It is a free, unofficial, community-run API that scrapes/republishes data originally published by AMFI (Association of Mutual Funds in India, the official industry body). It has no company behind it, no SLA, no support channel, and no uptime commitment.

AMFI directly (free, official) — AMFI publishes the complete daily NAV file for every scheme in India at portal.amfiindia.com/spages/NAVAll.txt (and historical files). This is the authoritative source that mfapi.in itself is built on. The standard production approach is a small daily job that downloads this file into the app's own database — after which fund search, NAVs, and benchmarks are all served locally with zero third-party dependency at request time.
